Medicare Health Outcomes Survey (HOS) – Monitoring Physical Activity

**Who:** Adults aged 65 or older as of December 31 of the measurement year.

**Why:** The Health Outcomes Survey gathers valid, reliable, and clinically meaningful health status data about a patient’s physical activity. This tool initiates the conversation between physician and patient about the importance of physical activity and any activity limitations the patient may present with.

**What:** Percentage of patients 65 years or older who had a doctor’s visit in the past 12 months and received advice to start, increase, or maintain their level of exercise or physical activity.

**How:** This is a patient-reported measure which surveys a random sample of Medicare beneficiaries. The Health Outcomes Survey is administered annually; the same member cohort is surveyed again two years later to account for baseline and follow-up results. Health Outcomes Survey quality measures include two functional health measures and three HEDIS Effectiveness of Care measures used in the annual Medicare Part C Star Ratings.

**Monitoring Physical Activity is based on two survey questions:**

1) In the past 12 months, did you talk with a doctor or provider about your level of exercise or physical activity?

2) In the past 12 months, did a doctor or other health care provider advise you to start, increase or maintain your level of exercise or physical activity?
